ENVIRONMENTAL MANAGEMENT

0680/02

Paper 2

October/November 2009

1 hour 45 minutes

Candidates answer on the Question Paper.

Additional Materials: Ruler

READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use a soft pencil for any diagrams, graphs or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **both** questions.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

For Examiner's Use	
1	
2	
Total	

This document consists of **16** printed pages.

- 1 (a) The graph shows percentages of people **without** access to water supply and sanitation in three continents.

- (i) Average percentages for the World
 without water supply 18
 without sanitation 40

Add the percentages for the World to the graph. [2]

- (ii) Compare the percentages for the World with those for each continent.

Africa

.....

Asia

.....

Europe

.....

[3]

(iii) State one reason why more people in the world have access to water supply and to sanitation.

.....
.....
..... [2]

(b) (i) If people do not have access to a piped water supply, from where do they obtain their drinking water? Name one source.

..... [1]

(ii) How safe, for drinking, is the water from this source? Explain your answer.

.....
.....
..... [2]

(c) One method for a country to increase supplies of clean water is desalination (extracting fresh water from sea water).

Why is desalination widely used in some Middle Eastern countries, especially Saudi Arabia, UAE and Kuwait, but rarely used elsewhere?

.....
.....
.....
.....
..... [3]

- (d) Over three million people in the world die each year from water-related diseases. **Water** is the largest killer.
- (i) The graph shows rainfall for Maputo, the capital of Mozambique. It is located 25° south of the Equator in Africa.

The percentage of the workforce with malaria at a factory in Maputo varied during the year.

Percentage of workforce with malaria											
J	F	M	A	M	J	J	A	S	O	N	D
6	17	19	22	25	13	11	8	11	8	5	4

Draw a line graph above the rainfall graph to show these percentages for Maputo. [3]

(ii) When is the wet season in Maputo?

..... [1]

(iii) At what time of year are there most cases of malaria among the workforce?

..... [1]

(iv) How and why does the pattern of rainfall during the year affect the percentage of workers with malaria? Explain as fully as you can.

.....

 [3]

(e) Information about malaria

Deaths per 100,000 people with malaria

	1900	1925	1950	1975	2000
In the world	200	170	50	20	25
In Africa	220	210	180	120	160

- * 500 million cases a year world-wide
- * 2–3 million people die from it every year
- * At least 1 million deaths are in Africa
- * Over 2 billion people (1 in 3 in the world) are at risk
- * Most sufferers contract malaria two or three times a year

(i) Describe how the information shows that malaria is a more serious problem in Africa than in the rest of the world.

.....

 [3]

(ii) Malaria is an important factor keeping people and countries in Africa poor. In two ways it does this.

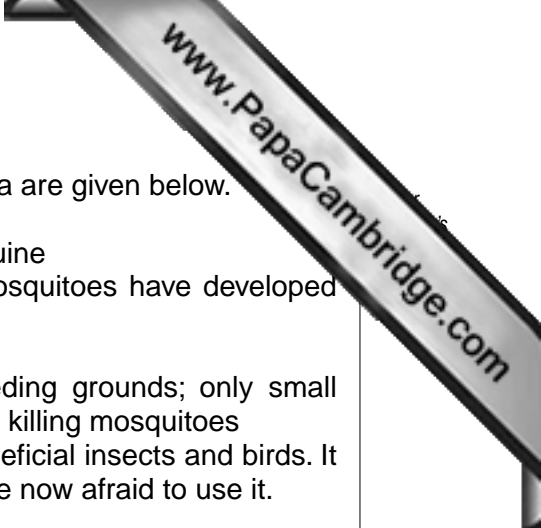

.....
.....
.....
..... [2]

(f) The diagram shows how the female mosquito spreads malaria.

(i) Why is malaria a water-bred disease?

.....
..... [1]

(ii) Details about the two early methods of controlling malaria are given below.

Method 1 – Use of cheap medicines, especially chloroquine

Problem: so widely used to treat tropical fevers that mosquitoes have developed resistance to it.

Method 2 – Spraying the pesticide DDT on the breeding grounds; only small amounts needed to be used, yet it was highly effective in killing mosquitoes

Problem: its careless use killed many fish as well as beneficial insects and birds. It has such a bad name that many African governments are now afraid to use it.

For each method, name the stage in the diagram which it was trying to control.

Method 1

Method 2 [2]

(iii) For as long as they were effective, both methods were suitable for use in poor African countries. Explain why.

.....
.....
.....
..... [2]

(iv) Methods for improved malaria control in Africa are available.

A

Spraying the inside and outside of huts with DDT.

B

Sleeping under mosquito nets treated with insecticide; these are re-treated with insecticide every six months.

C

Use the drug artemisia, made from a Chinese herb – it cures 90% of patients within 3 days at a cost of up to US\$10 per person; acting quickly reduces the chance of drug resistance developing. It is in short supply.

Describe how these methods are improvements upon the two early methods already named.

.....

.....

.....

.....

.....

.....

.....

.....

..... [3]

(g) Read the newspaper reports below.

A From South Africa

DDT can work

In 1996 the South African government, under pressure from environmental groups both at home and abroad, abandoned the use of DDT. The number of cases of malaria jumped from around 10,000 per year to more than 60,000 by 2000.

When the government re-introduced DDT spraying in the middle of 2000, the results were dramatic. By the middle of 2001, the number of cases of malaria was cut in half, and deaths from it fell from 432 to 146.

B From Kenya

Project to distribute free ITNs hailed as a great success

In 2003 Kenya's Ministry of Health began the distribution of 13.5m ITNs (insecticide treated nets). The cost was kept low by government subsidies. Even so, 3.4m had to be given away free to the poorest, unable to afford even subsidised nets.

Partly funded by the WHO (World Health Organisation), this campaign was better supported by education than previous ones. In the past, nets that were given away free were re-sold, or used for fishing, or thrown away instead of being re-treated when the insecticide wore off.

Four years later, early results show that childhood deaths from malaria have fallen by almost 50%. Three hospitals along the malaria-prone coast reported a 57% drop in malaria admissions by 2006.

(i) Describe the evidence which shows that the improved malaria control methods can work.

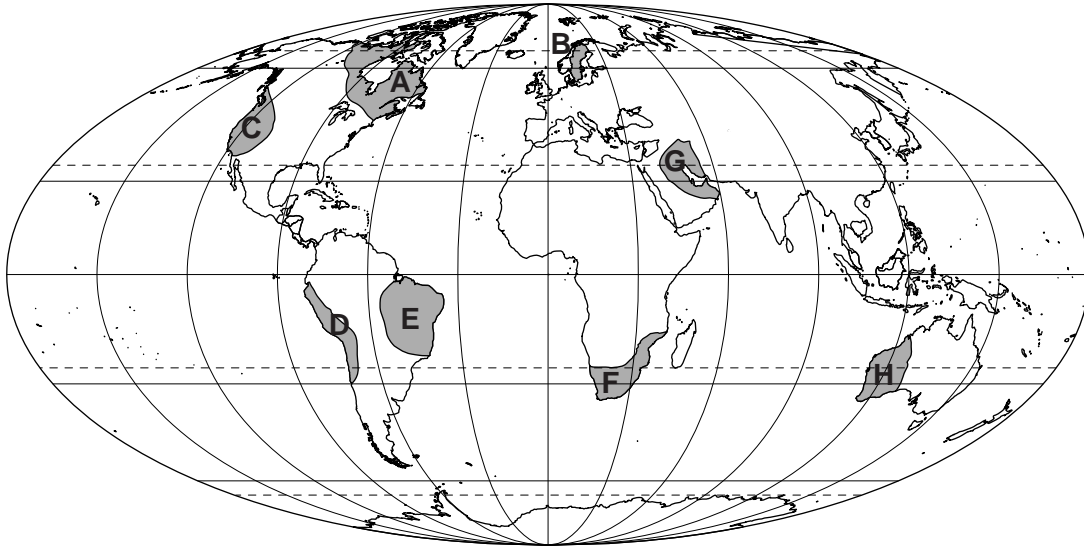

.....
.....
.....
..... [2]

(ii) Suggest reasons why many African countries are slow to use these new methods.

.....
.....
.....
.....
.....
.....
.....
..... [4]

2 Some parts of the Earth's surface are mineral-rich.

Some mineral-rich regions

Key
 [shaded box] mineral-rich

(a) (i) Minerals from these regions include oil, copper, tin, diamonds, gold, iron-ore, nickel and uranium.

Name two of the regions shown on the map. From the list, name one mineral mined in the region.

Letter Name of region Mineral

Letter Name of region Mineral [4]

(ii) Most of the minerals in the list have more than one use; sometimes their uses are very different. Elaborate on this statement by choosing one mineral and naming some of its uses.

.....

 [2]

(iii) Explain why some parts of the Earth's surface are mineral-rich while others are mineral-poor.

.....
.....
.....
.....
.....
.....
..... [3]

(b) The diagram shows how long the known reserves of eight minerals are expected to last.

Minerals – World Reserves in 2005

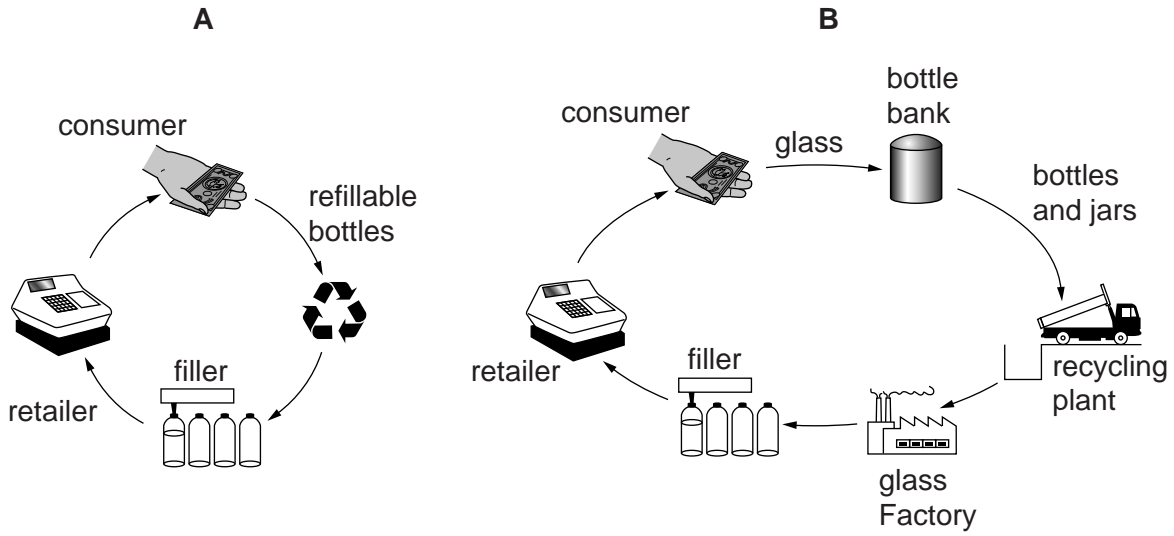

(i) How many years are reserves of nickel expected to last?

..... [1]

(ii) Explain why all these minerals will eventually run out.

.....
.....
.....
.....
..... [3]

(c) Two ways to extend the length of time before natural resources run out are in the flow diagrams below.

(i) Describe how each one increases the number of years before natural resources run out.

.....

.....

.....

.....

(ii) Which one is better for the environment? Explain your choice.

.....

.....

.....

[4]

- (d) Another way of extending the life of natural resources is to develop and use alternative energy sources. Hydro-electric power (HEP) is an example of an alternative energy source.

Hydro-electric power station in the Alps

- (i) Why is this a good location for generating hydro-electric power?

.....
.....
.....
..... [2]

- (ii) Explain what people have done to enable energy to be generated here.

.....
.....
.....
..... [3]

- (iii) In a location like this, the cost of making electricity from HEP is almost the same as that from oil. State two advantages of HEP over oil for generating electricity.

.....
.....
.....

(iv) Oil provides 40% of world energy, compared with only 6% from HEP. Why is the difference so great?

.....

.....

.....

.....

.....

.....

..... [3]

(e) Production of biofuels from crops such as sugar cane, palm oil and corn (maize) is increasing. The fuel from them can be used as alternatives to petrol and diesel in cars and trucks.

Biofuel production in 2005

(percentage of world total)

Brazil	41
USA	39
EU (European Union)	16
China	3
India	1

Complete a divided bar graph to show biofuel production in 2005.

[3]

(f) Some information about biofuel production in Brazil and the USA is given below.

	Brazil (from sugar cane)	USA (from corn)
Average cost of production of ethanol, compared with petrol (petrol = 1.0)	0.4	0.7
Fossil fuel input (transport and processing) needed for making ethanol (%)	11	70
Carbon dioxide reduction compared with oil (%)	90	20
Ethanol output from one hectare of land (equivalent litres of petrol)	3,000 – 6,000	1,500 – 3,000

(i) Which crop makes cheaper ethanol?
 [1]

(ii) Give one reason why it is cheaper.

 [1]

(iii) In which one of the two countries is the environmental impact from ethanol lower? Explain your choice.

 [3]
