International General Certificate of Secondary Education

## MARK SCHEME for the May/June 2006 question paper

# 0648 FOOD AND NUTRITION

www.papacambridge.com

0648/01

Paper 1 maximum raw mark 100

This mark scheme is published as an aid to teachers and students, to indicate the requirements of the examination. It shows the basis on which Examiners were initially instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began. Any substantial changes to the mark scheme that arose from these discussions will be recorded in the published *Report on the Examination*.

All Examiners are instructed that alternative correct answers and unexpected approaches in candidates' scripts must be given marks that fairly reflect the relevant knowledge and skills demonstrated.

Mark schemes must be read in conjunction with the question papers and the *Report on the Examination*.

The minimum marks in these components needed for various grades were previously published with these mark schemes, but are now instead included in the Report on the Examination for this session.

• CIE will not enter into discussion or correspondence in connection with these mark schemes.

CIE is publishing the mark schemes for the May/June 2006 question papers for most IGCSE and GCE Advanced Level and Advanced Subsidiary Level syllabuses and some Ordinary Level syllabuses.

Page 1       Mark Scheme       Syllabus         IGCSE - MaylJune 2006       0648         Section A         (a) carbon - hydrogen - oxygen $3 \times 1 \text{ mark}$ (b) Functions of fat warmth/heat energy energy store protein sparing insulation protection of internal organs conveys fat soluble witamins/vitamins A and D formation of cell membranes increases calorific value of food without adding bulk high satiety value       [4]         (c) (i) Saturated fat contains maximum hydrogen single bonds solid at room temperature $2 \times 1 \text{ mark}$ [2]         (ii) Examples butter - lard - dripping - cream - coconut oil etc. $2 \exp protection and absorption of fatmore than one double bond in moleculeliquid/oil at room temperature2 \times 1 \text{ mark}       [2]         (iii) Polyunsaturated fatcontaise on the ouble bond in moleculeliquid/oil at room temperature2 \times 1 \text{ mark}       [2]         (iv) Examplessunflower oil - soya oil - com/maize oil etc.2 \exp protein and absorption of fatin ducdenum - bile - from gall bladder - emulsifies fat -lipase - from pancreatic juice - converts fats to glycerol - and fatty acid(allow action of lipase once)absorbed in ileum - into lacteal - of vili - then into lymphatic system10 \text{ points = 5 marks}       [5]         (e) Excess of saturated fat in the dietstored as fat - under skin - as adipose lissue - hypertensionor round internal organs - causing obesity - breathiessness -listhargy - problems during surgery - lack of self-esteem -cholesterol - deposited in block vessels - narrows - blocks -heat problems/CHD etc.    $	Page	1		Scheme	Syllabus

#### Section C

#### (a) Different raising agents and their uses in the preparation of dishes. 8

The answer may include the following knowledge and understanding.

### Principles of raising agents

gases expand when heated - mixture enlarges/expands/swells steam has a larger volume than water hot gases rise - push up mixture heat sets risen shape - protein in other ingredients coagulates e.g. egg, gluten in flour etc.

#### Air

gives a light texture - no change in colour - or flavour must be introduced before cooking - expands on heating sieving flour - air trapped between grains of flour creaming fat and sugar - traps air as tiny bubbles rubbing-in fat and flour - air trapped as mixture falls whisking egg white - meringues - ovalbumin stretches entangles 7x own volume of air whisking whole egg and sugar - traps less air - due to fat in egg yolk used in cakes e.g. Swiss roll folding and rolling - flaky pastry/puff pastry - air trapped between layers sealed to prevent air loss - expands on heating - pushes layers apart etc.

### Carbon dioxide

bicarbonate of soda - with moist heat - gives off carbon dioxide residue of sodium carbonate - washing soda - yellow colour - bitter flavour used in dishes where this would be hidden - e.g. gingerbread etc.

bicarbonate of soda and cream of tartar - moist heat gives off carbon dioxide - colourless and tasteless residue - Rochelle salt e.g. scones etc.

bicarbonate of soda and sour milk - as above - acid + alkali

baking powder - contains correct proportion of bicarbonate of soda and cream of tartar e.g. suet pastry, scones, cakes etc.

self-raising flour - plain flour + baking powder - as above

yeast - feeds on sugar - moisture - warmth - ferments sugar - produces alcohol - and carbon dioxide - continues to produce under favourable conditions - heat of oven kills yeast - fermentation stops - e.g. bread etc.

#### Steam

used in mixtures with a high proportion of liquid e.g. choux pastry. Yorkshire puddings etc. hot oven - water changes to steam -

8	(a)			MM. Bahacannbridge Total 15
	Mark Bands	Descriptors	Part Marks	Total 19
	High	The candidate is able to name all gases	11-15	15
		The candidate demonstrates a clear understanding of how gases are introduced Good examples used to illustrate		
		Correct terminology used where appropriate		
		Candidate can state clearly how raising occurs and how shape is set		
		Comments are precise and related to named examples.		
	Middle	The candidate can name at least 2 gases	6-10	
		Can give a few examples of how gases are introduced		
		Factual information is sound but not always linked to specific examples to illustrate		
		Information may be accurate but not all issues are considered		
	Low	The candidate can give 1 or 2 examples of gases	0-5	
		Action of gases may be considered in simple terms		
		Fails to use correct terminology		
		Information will be general and lacking in specific detail		

Limited knowledge of the topic will be

apparent

#### 8 (b) Different fats and oils and their uses in the preparation of dishes

#### Types of fats and oils

fats are solid at room temperature - oils are liquid at room temperature saturated fats hold as much hydrogen as they can - may include a diagram molecule has single bonds - e.g. butter, lard, suet - may include diagram found in animal products - e.g. milk, cream, bacon, meat etc. cholesterol in saturated fat - deposited in arteries - narrows - blocks associated with coronary heart disease - excess causes obesity oils can be monounsaturated - one double bond - oleic acid - in olive oil can take up more hydrogen - at double bond - to make single bonds polyunsaturated fats - more than 2 double bonds - linoleic acid hydrogenation - nickel catalyst - hardens oils - changes uses oils hydrogenated to make margarine - if process not complete fat is softer fats and oils made up of different fatty acids and glycerol different fatty acids produce fats and oils of differing 'hardness' -'soft' margarine is easier to cream - 'hard' margarine easier to rub in at least 40 different fatty acids known - butyric, oleic, stearic etc. all have different properties - taste, decomposition point etc. choose fat or oil according to use oils usually from plants - e.g. corn, sunflower, soya etc. some animals produce oil - fish oils, whale oil etc. some plants produce solid fat - cocoa butter fats and oils have different smoke points - high smoke points for frying fats decompose into glycerol and fatty acid on heating - irreversible butter decomposes at too low a temperature for frying - corn oil at a high temp. fatty acids have different flavours - butyric acid in butter pleasant - etc.

#### Uses

spreading on bread - butter, margarine frying - corn oil, sunflower seed oil, dripping sauce-making - margarine, butter aeration - margarine traps air when creamed with sugar in cake-making pastry-making - holds layers apart in flaky and puff pastry shortening - crumbly texture of shortcrust pastry, rock buns adding flavour - butter used in cake making improve keeping quality - rich cakes e g. Christmas cake remains moist sealing - melted butter/margarine on pate to retain moisture adds calories without adding bulk - fried food dressings - French dressing, form an emulsion - mayonnaise basting - adds moisture to meat cooked by dry heat/grilled/roasted etc. vegans will not use animal fat - those with CHD choose polyunsaturated fats etc.

Mark Bands	Descriptors	Part Marks Total	"Dri
High	The candidate is able to state different types of fats and oils	Syllabus 0648 Part Marks Total 11-15 15	3
	Can describe compositions of fats		
	May give scientific information		
	Can name a variety of fats and oils		
	Can give many uses of fats and oils -		
	Demonstrates a clear understanding of the topic		
	Comments are precise and related to named examples		
	Specific terminology is used where appropriate		
	Information is generally accurate		
Middle	The candidate can state some of the different types of fats and oils	6-10	
	Gives some additional information in support of statements		
	Several uses of fats and oils named		
	Examples often given to illustrate		
	Some scientific information may be attempted		
	Information accurate but not all issues are considered		
	Response tends to be factual		
	Does not always seem to understand the points made		
Low	Can give a few facts about different fats and oils	0-5	
	Little attempt to explain differences		
	Does not consider a wide range of uses		
	A few examples given		
	Information is general and lacks specific detail		
	Limited knowledge of the topic will be apparent
