Unit: 4CH0

Paper: 2CR

Tuesday 10 June 2014 – Afternoon

Time: 1 hour

Paper Reference

4CH0/2CR**You must have:**

Calculator

Total Marks

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
– *there may be more space than you need.*
- Show all the steps in any calculations and state the units.
- Some questions must be answered with a cross in a box ☒. If you change your mind about an answer, put a line through the box ☒ and then mark your new answer with a cross ☒.

Information

- The total mark for this paper is 60.
- The marks for **each** question are shown in brackets
– *use this as a guide as to how much time to spend on each question.*

Advice

- Read each question carefully before you start to answer it.
- Keep an eye on the time.
- Write your answers neatly and in good English.
- Try to answer every question.
- Check your answers if you have time at the end.

Answer ALL questions.

1 Neon is an element with atomic number 10.

(a) Which sub-atomic particles are present in the nucleus of a neon atom?

(1)

- ☐ **A** electrons and neutrons
- ☐ **B** electrons and protons
- ☐ **C** electrons and neutrons and protons
- ☐ **D** neutrons and protons

(b) Use words from the box to complete the sentences about the particles in a neon atom.

Each word may be used once, more than once or not at all.

(3)

electrons

neutrons

nuclei

protons

The particles with the smallest mass are

An atom of neon has no overall charge because it contains equal numbers

of and

The chemical properties of neon depend on the number of

..... in the outer shell.

(c) What is the electronic configuration of a neon atom?

(1)

- ☐ **A** 2.8
- ☐ **B** 2.2.6
- ☐ **C** 2.8.8
- ☐ **D** 2.8.8.2

(d) Neon has two main isotopes that can be represented as ^{20}Ne and ^{22}Ne .

- (i) Explain, with reference to sub-atomic particles, what is meant by the term **isotopes**.
(2)

.....

.....

.....

.....

- (ii) The relative atomic mass of neon is 20.2

How does this information support the fact that a sample of neon contains more ^{20}Ne than ^{22}Ne ?

(1)

.....

.....

(e) Neon belongs to the family of noble gases and is inert.

- (i) What is meant by the term **inert**?
(1)

.....

.....

- (ii) Why are noble gases inert?
(1)

.....

.....

(Total for Question 1 = 10 marks)

2 This question is about the reactions of some metals and their compounds.

- (a) A student adds a sample of four metals R, S, T and U separately to water and to dilute sulfuric acid.

The table shows the observations in each experiment.

Metal	Observation with water	Observation with dilute sulfuric acid
R	no change	bubbles form slowly
S	bubbles form quickly	bubbles form very quickly
T	no change	no change
U	bubbles form slowly	bubbles form quickly

- (i) State two properties of the metals that the student should keep the same in all of the experiments in order to compare their reactivity.

(2)

1

.....

2

.....

- (ii) Which is the least reactive metal?

(1)

- ☐ **A** metal R
- ☐ **B** metal S
- ☐ **C** metal T
- ☐ **D** metal U

- (iii) Which gas forms during the reactions with dilute sulfuric acid?

(1)

- ☐ **A** carbon dioxide
- ☐ **B** hydrogen
- ☐ **C** oxygen
- ☐ **D** sulfur dioxide

- (b) The student carries out a test to show that the solution formed when metal U reacts with dilute sulfuric acid contains sulfate ions.

Use words from the box to complete the sentence about this test.

Each word may be used once, more than once or not at all.

(2)

brown precipitate

solution of barium chloride

solution of silver nitrate

solution of sodium hydroxide

white precipitate

yellow precipitate

He adds a and observes

the formation of a

- (c) The student observes a lilac colour in a flame test on a small sample of a different metal compound.

Which metal ions cause the formation of this colour?

(1)

- ☐ **A** copper
- ☐ **B** magnesium
- ☐ **C** potassium
- ☐ **D** zinc

(Total for Question 2 = 7 marks)

- 3 The thermite reaction is used on railways to produce molten iron for joining rails together. The diagram shows how this is done.

The equation for this thermite reaction is

- (a) What does this reaction show about the reactivity of iron compared to the reactivity of aluminium?

(1)

- (b) Why is this reaction described as displacement?

(1)

- (c) State two reasons why the term oxidation applies to aluminium in this reaction.

(2)

1

2

- (d) Although the thermite reaction is exothermic, it only begins after a lot of heat energy is supplied.

How is this heat energy supplied?

(1)

(Total for Question 3 = 5 marks)

BLANK PAGE

P 4 3 5 3 1 A 0 9 2 0

4 (a) Ethanol can be manufactured by two different processes.

Process 1 sucrose $\xrightarrow{\text{stage 1}}$ glucose $\xrightarrow{\text{stage 2}}$ ethanol

Process 2 ethene \longrightarrow ethanol

(i) What is the general name for compounds such as sucrose and glucose?

(1)

(ii) What type of reaction occurs in stage 2?

(1)

(iii) What is the catalyst used in stage 2?

(1)

(iv) What type of reaction occurs in process 2?

(1)

(b) The table shows the displayed formulae of four organic compounds.

ethene	propene
$ \begin{array}{c} \text{H} & & \text{H} \\ & \diagdown & / \\ & \text{C} = \text{C} \\ & / & \diagdown \\ \text{H} & & \text{H} \end{array} $	$ \begin{array}{c} & \text{H} & & \text{H} \\ & & \diagdown & / \\ \text{H} & & & \text{C} \\ & \diagdown & / & \diagdown \\ & \text{C} = \text{C} & & \text{H} \\ & / & \diagdown & \\ \text{H} & & \text{H} & \end{array} $
ethanol	compound D
$ \begin{array}{c} \text{H} & \text{H} \\ & \\ \text{H}-\text{C}-\text{C}-\text{O}-\text{H} \\ & \\ \text{H} & \text{H} \end{array} $	$ \begin{array}{c} \text{H} & \text{H} & \text{H} \\ & & \\ \text{H}-\text{C}-\text{C}-\text{C}-\text{H} \\ & & \\ \text{H} & \text{O} & \text{H} \\ & & \\ & \text{H} & \end{array} $

Ethanol and compound D are members of the homologous series of alcohols.

(i) The first member of this homologous series is methanol.

Draw the displayed formula of methanol.

(1)

(ii) Suggest the name of compound D.

(1)

(c) In industry, the conversion of propene to compound D uses the same conditions as those used in the conversion of ethene to ethanol.

Identify a suitable catalyst and temperature for these conversions.

(2)

catalyst

temperature °C

(d) Ethene and acetylene can both be used for welding metals.

The equations for the reactions of these gases in welding are

One problem with using hydrocarbons as fuels is incomplete combustion.

(i) Incomplete combustion is a bigger problem with ethene than with acetylene.

Suggest why.

(1)

.....

.....

.....

(ii) One of the gases produced during incomplete combustion is dangerous to humans.

Identify this gas and explain how it is dangerous.

(3)

.....

.....

.....

.....

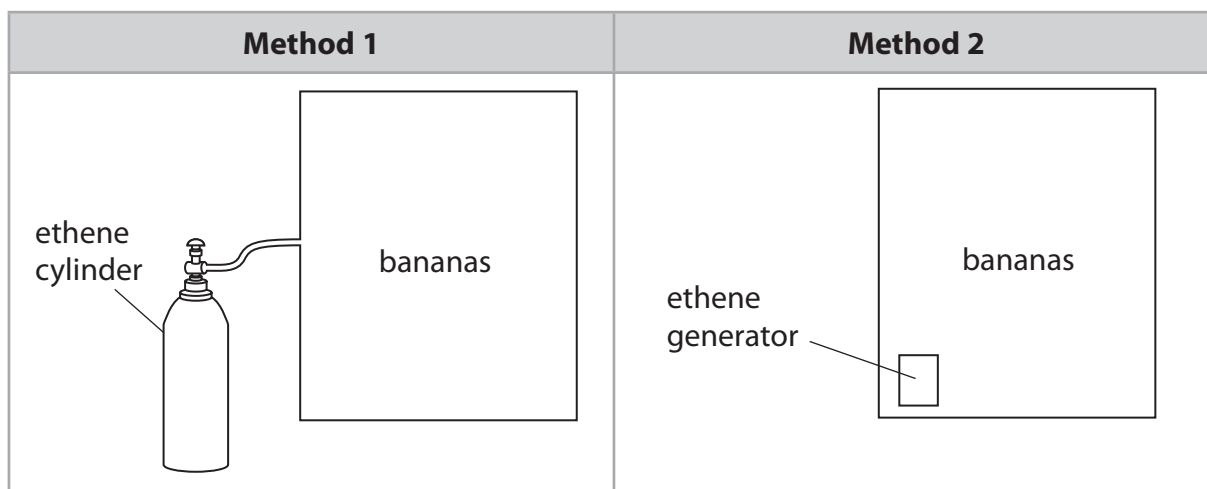

.....

.....

(e) Ethene can be used to ripen bananas.

Bananas are placed in a large container and ethene is added. The ethene can be added in two different ways.

- (i) In method 1, ethene is stored under pressure and passed through a pipe into the container.

Suggest one risk in using this method.

(1)

- (ii) In method 2, the generator contains a known quantity of ethanol that is slowly decomposed to ethene using a catalyst.

Write a chemical equation for this decomposition.

(1)

(Total for Question 4 = 14 marks)

5 Solutions of lead(II) nitrate and sodium sulfate react together to form the insoluble salt lead(II) sulfate.

(a) A student wrote this plan to prepare a pure dry sample of lead(II) sulfate.

- step 1 pour some lead(II) nitrate solution into a beaker
- step 2 add sodium sulfate solution until the reaction is complete
- step 3 filter the mixture
- step 4 heat the filtrate to evaporate some of the water
- step 5 cool the filtrate and remove the crystals

(i) How will the student know when the reaction in step 2 is complete?

(1)

(ii) Which compound could the student use in this preparation instead of sodium sulfate?

(1)

- ☐ **A** lead(II) hydroxide
- ☐ **B** nitric acid
- ☐ **C** sodium hydroxide
- ☐ **D** sulfuric acid

(iii) State why the student should not have included steps 4 and 5 in his plan.

(1)

(iv) Suggest replacement steps to obtain a pure dry sample of lead(II) sulfate.

(2)

step 4

step 5

(v) Lead(II) carbonate cannot be used instead of lead(II) nitrate in this preparation.

This is because lead(II) carbonate

(1)

- ☐ **A** contains ionic bonding
- ☐ **B** has a high relative formula mass
- ☐ **C** is insoluble in water
- ☐ **D** is toxic

(b) The equation for the reaction in the student's plan is

(i) Deduce the amount of each reactant needed to form 0.150 mol of lead(II) sulfate.

(1)

$\text{Pb}(\text{NO}_3)_2$ mol

Na_2SO_4 mol

(ii) What volume of 0.500 mol/dm³ lead(II) nitrate solution is needed to form 0.150 mol of lead(II) sulfate?

(2)

volume =

(Total for Question 5 = 9 marks)

- 6 A student does some experiments to find the heat energy released when natural gas burns. She uses this apparatus.

- (a) The diagram shows the thermometer readings in one of her experiments.

Use these readings to complete the table, entering all values to the nearest 0.1 °C.

(3)

temperature of water at start in °C	
temperature of water at end in °C	
temperature change in °C	

(b) The student repeats the experiment three times.

The table shows her results.

Experiment	Volume of gas burned in cm ³	Temperature rise of water in °C
1	1450	34.8
2	1875	41.2
3	1620	37.7

- (i) Calculate the amount, in moles, at room temperature and pressure, of methane burned in experiment 1.

Assume that natural gas contains only methane.

(The volume of 1 mol of a gas at room temperature and pressure is 24 000 cm³)

(2)

amount = mol

- (ii) The quantity of heat energy released in experiment 1 is 29 200 J.

Calculate the molar enthalpy change, in kJ/mol, for the combustion of methane.

(2)

molar enthalpy change = kJ/mol

- (iii) The temperature rise in experiment 2 is 41.2 °C.

Calculate the heat energy change in experiment 2 using the expression

heat energy change = volume of water × 4.2 × temperature change

(in J)

(in cm³)

(in °C)

(2)

heat energy change = J

- (iv) The student uses the results from experiment 3 to calculate the molar enthalpy change, in kJ/mol, for the combustion of methane.

She compares her value with the value in a data book.

student's value	$\Delta H = -510 \text{ kJ/mol}$
data book value	$\Delta H = -890 \text{ kJ/mol}$

Which is the best explanation for the large difference between these two values?

(1)

- ☐ **A** natural gas contains other gases that release heat energy when burned
- ☐ **B** not all of the heat energy is transferred to the water
- ☐ **C** some of the water evaporates during the experiment
- ☐ **D** the student measures the gas by volume instead of by mass

- (c) The student uses a table of average bond energies to calculate another value for the molar enthalpy of combustion of methane.

Bond	C—H	O=O	C=O	H—O
Average bond energy in kJ/mol	412	496	743	463

The equation for the combustion can be shown using displayed formulae.

- (i) Use values from the table to calculate the energy taken in when the bonds in the reactants are broken.

(2)

energy taken in = kJ

- (ii) Use values from the table to calculate the energy given out when the bonds in the products are formed.

(2)

energy given out = kJ

- (iii) Use your answers to (i) and (ii) to calculate the molar enthalpy change for the combustion of methane.

(1)

molar enthalpy change = kJ/mol
